

Major Topics you are expected to know

1. Insertion, deletion, search in sorted and unsorted array. Complexity.
2. Abstract classes and interfaces. Differences.
3. What is ADT? Is interface an ADT? Why do we need interface? How to implement it?
4. JUnit testing. What is the purpose? How to write a simple a test case.
5. Singly, doubly and circular linked lists. You should be able to
 - a. add a new node at any position (list with head only, or head and tail)
 - b. remove a node from any position (list with head only, or head and tail)
 - c. search for a given node.
 - d. Iterate through the list.
 - e. What is the running time for these operations?
6. Iterators. Implementation, purpose. What is the difference between Iterator and ListIterator.?
7. Generics. Why do we need it? What problem does it solve? How to make a class generic? How to create a generic object? Diamond operator.
8. Complexity: definition of big-O, big-Theta, big-Omega. Determine the running time for a given piece of code.
9. Stack and Queues. Different Implementations. Running time for pop, push, enqueue and dequeue. Adapter design pattern: what is the idea, can we use it to implement a stack? How? Queue? Does it matter what end of the linked list (singly, doubly) will we choose? How about ArrayList, can it be used for stack implementation?
10. 3 types of sorts - selection, bubble and insertion. You should be able to trace each one given unsorted array. Running times for best, average and worst cases.
11. You need to review your doubly linked list and iterator implementation.
12. You must know all the running times for all algorithms we talk in class.
